

## Beginning of C programming →

\* A simple program to print a line or some text

```
// first program in C
#include <stdio.h>

// function main begins program execution
int main (
{
    printf(" Hello India\n");
    return 0;
} // end function main
```

Output HelloIndia

Now step by step we will see that what this program basically consist line by line

⇒ // first program in C

// this shows that the following this is a comment.

- (a) to improve readability
- (b) do not cause computer to perform any action
- (c) ignored by compiler and do not cause any M/C language object code to be generated
- (d) It just help the people to read and help the program.

[ /\* ..... It is used to multiline comment.  
.....  
\*/ ]

⇒ #include Preprocessor Directive

In this #include <stdio.h> is a directive to preprocessor. This tells to preprocessor to include the contents of the
