

CONTEXT-FREE GRAMMARS

→ **Chomsky (Linguist)** described four classes of generative devices or grammars that defines four classes of languages.

→ Two of these grammars classes

Context-free

Regular

→ These grammars turned out to be useful for describing the syntax of **Programming Language**.

- Regular Grammar $\xrightarrow{\text{Describes}}$ Tokens } of P.L.
- Context-free Grammar $\xrightarrow{\text{Describe}}$ Syntax } P.L.

Basically

Context-free Grammar is a Language Generator which describes **Syntax** of Natural Language.

BACKUS-NAUR FORM

In 1960 John Backus and Peter Naur introduced formal notation method for describing Syntax of programming Language which is known As Backus - Naur Form, or simply **BNF**

* **BNF** was basically designed for ALGOL 60

BNF and context-free Grammars was nearly identical.

BNF is a metalanguage for programming languages.

Metalanguage is a language that is used to describe another language

BNF: Symbols to describe a Syntax

::= means 'is defined as'

<> means 'can be described as'

| means 'or'

BNF uses "abstractions" for Syntactic Structures.

For Eg:- Java assignment Statement

$\langle \text{assign} \rangle \rightarrow \langle \text{var} \rangle = \langle \text{expression} \rangle$

Non Terminal Terminal.
Computer Science Lectures By ER. Deepak Garg

Terminals: Symbols that can appear in the Output of a language because of its rules, but cannot be changed by rules themselves.

Non-Terminals: Syntactic entities that defines a part of the grammar.

Non-Terminals can be **replaced** and they are string, composition of **Terminals** and **Non-Terminals**

Eg. of Terminals

+ = { } * |

if while do, int

double float A, B

Eg. of Non-Terminals:

Sentences

words

terms

Expressions

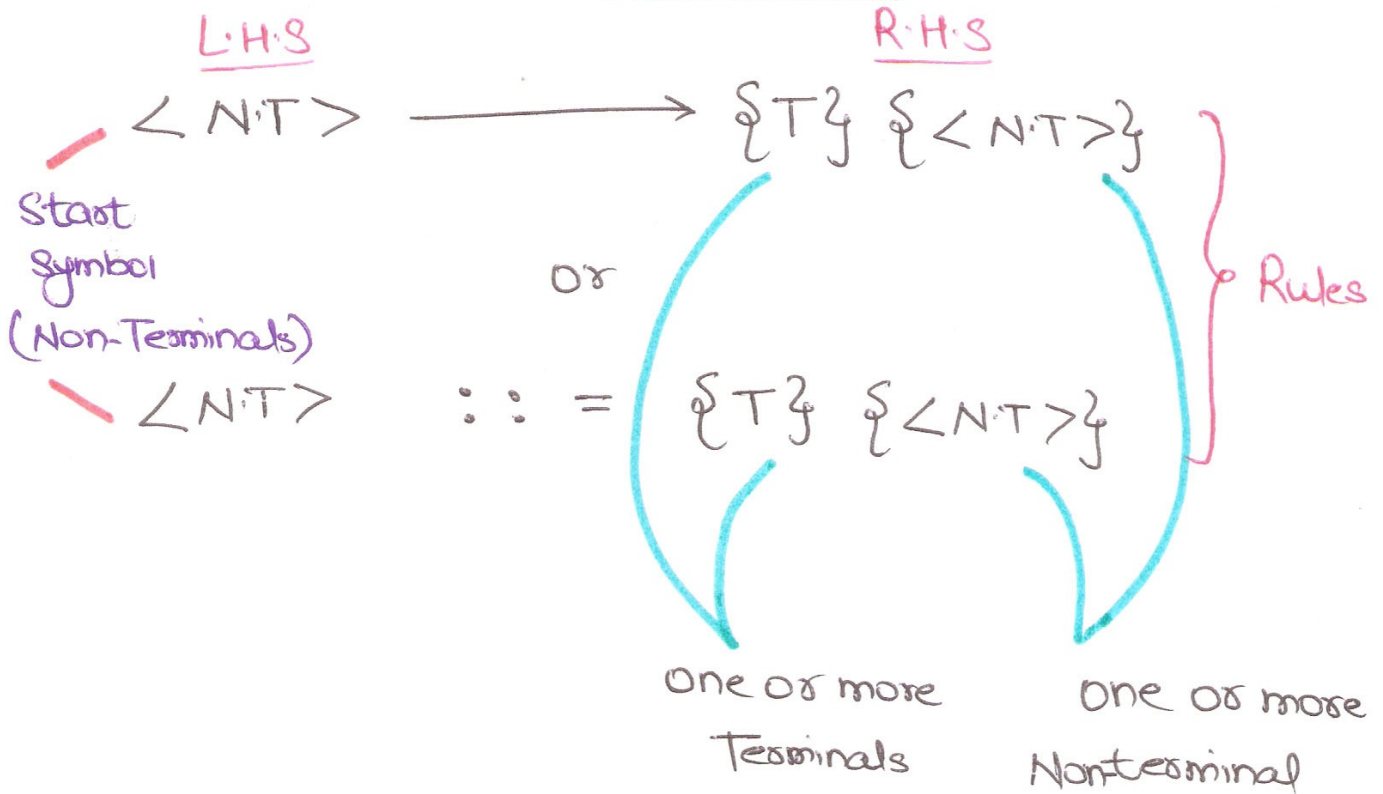

Statements

Programs

List of Numbers.

How To write Rules in BNF

Example : if loop structure ①

if (condition)

{
body
}

Subscribe to our

You  **Channel**

BNF of structure ①

$\langle \text{if-loop} \rangle ::= \langle \text{if-part} \rangle$

$\langle \text{if-part} \rangle ::= \text{if} (\langle \text{condition} \rangle) \{ \langle \text{body} \rangle \}$

or

$\langle \text{if-loop} \rangle ::= \text{if} (\langle \text{condition} \rangle) \{ \langle \text{body} \rangle \}$

Structure ②

```
if (condition)
{
    body
}
else
{
    body
}
```

YouTube Channel

BNF of Structure ②

① $\langle \text{if-loop} \rangle ::= \langle \text{if-part} \rangle \langle \text{else-part} \rangle$

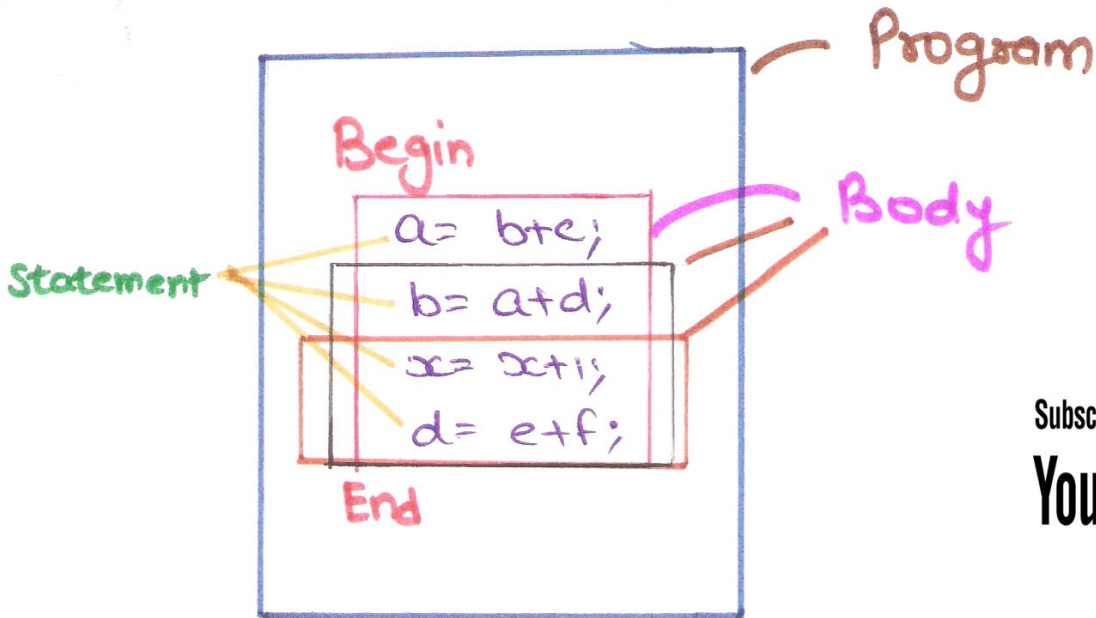

$\langle \text{if-part} \rangle ::= \text{if} (\langle \text{condition} \rangle) \{ \langle \text{body} \rangle \}$

$\langle \text{else-part} \rangle ::= \text{else} \{ \langle \text{body} \rangle \}$

or

② $\langle \text{if-loop} \rangle ::= \text{if} (\langle \text{condition} \rangle) \{ \langle \text{body} \rangle \} \text{ else } \{ \langle \text{body} \rangle \}$

Example : Recursion in BNF
